India's Unified Payments Interface (UPI): System Overview and Impact

Deep Research • Generated 2026-08-12 18:40 UTC

Executive summary

UPI is a 24x7x365 real-time payment system launched by NPCI in 2016 to link multiple bank accounts into a single mobile application and enable instant inter-bank transfers.[3][4][14] It operates under NPCI governance and Payment and Settlement Systems Act authorization, with transaction routing and processing handled in the UPI ecosystem and settlement taking place in RBI's RTGS system.[2][5][11] The supplied evidence shows very large scale, including reported growth from 0.09 million transactions in July 2016 to 16,730.01 million in Dec-2024, 13.89 billion transactions in June 2024, and 19.46 billion transactions in July 2025.[18][19][22] The same evidence also portrays UPI as a dominant retail payment rail with broad bank participation, hundreds of millions of users, tens of millions of merchants, meaningful merchant acceptance, and an active roadmap around product expansion and international rollout, while also pointing to cybersecurity, user-awareness, connectivity, and scaling challenges.[24][26][29][30][39][40][44][45][48][49][50]

[1][3][24][38]

Technical architecture and core components

UPI is an interoperable real-time mobile payment system that links multiple bank accounts and enables instant inter-bank transfers through features such as virtual payment addresses, push and pull payments, payment requests, and QR codes.[1][3][4][10]

The supplied architecture evidence says UPI supports user registration, bank-account linking, VPA creation, push and pull transactions, payment requests, QR-code payments, transaction history, notifications, bill payments, and recurring payments.[1] Evidence describing UPI as an open-source interoperable API also says it facilitates real-time transfers between individuals with accounts at participating banks.[10] One design description adds that UPI should handle millions of users and high transaction volumes, especially during peak hours.[45]

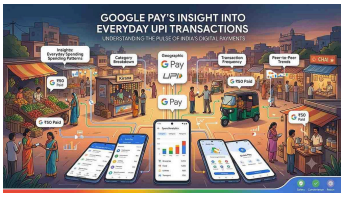

NPCI is described as the orchestrator that defines ecosystem rules and responsibilities, manages transaction processing, and provides routing, processing, and settlement services to participating members.[2] A World Bank case study adds that UPI and IMPS infrastructure is owned and operated by NPCI, and that settlement takes place in RBI's RTGS system.[7][11]

UPI technical architecture: user app, virtual payment address, participating banks, NPCI switch, and RTGS settlement

[1][2][11]

The supplied scalability descriptions cite horizontal scaling, load balancing, database sharding, caching, asynchronous processing, and CDN integration as relevant design mechanisms for handling growth and load.[44] One architectural article also states a transaction limit of ₹1 lakh per transaction and 20 transactions per day.[47]

Vibrant market where people of all walks use UPI for everyday transactions

Vibrant market where people of all walks use UPI for everyday transactions — AI-generated illustration, not derived from evidence

(unverified)

Regulatory and governance framework

UPI is operated by NPCI, authorised under the Payment and Settlement Systems Act, 2007, and settled through RBI's RTGS system.[5][11]

The regulatory evidence states that UPI is a payment system operated by NPCI and authorised under the Payment and Settlement Systems Act, 2007.[5] NPCI's governance role includes defining rules and regulations, assigning responsibilities to participating entities, managing transaction processing, and providing routing, processing, and settlement services in the ecosystem.[2] The supplied evidence also says the IMPS and UPI infrastructure is owned and operated by NPCI.[7]

RBI's role appears in the settlement layer and in policy direction around product scope.[11][46] The World Bank case study says settlement for IMPS and UPI takes place in RBI's RTGS system, and that RBI has issued guidelines for bringing PPIs into UPI.[11][46]

Development timeline and milestones

The core timeline in the supplied evidence is a 2016 launch by NPCI, followed by UPI 2.0 on August 16, 2018, and later milestones tied to scale and feature expansion.[3][13][14][15][52]

The evidence states that UPI was launched by NPCI in 2016, with one source specifying April 2016, and describes it as a 24x7x365 real-time fund transfer system linking multiple bank accounts into one mobile application.[3][13][14] A World Bank case study says UPI supports 1-click, 2-factor authentication using mobile as the first factor and UPI PIN as the second factor.[6]

UPI 2.0 was rolled out on August 16, 2018.[52] The supplied feature summary for UPI 2.0 says it introduced overdraft facilities, one-time mandates, invoicing, and QR-based payments.[15] A World Bank case study also says UPI currently supports bank accounts as underlying payment instruments, while support for PPIs is in the pipeline and RBI has issued guidelines in this regard.[46]

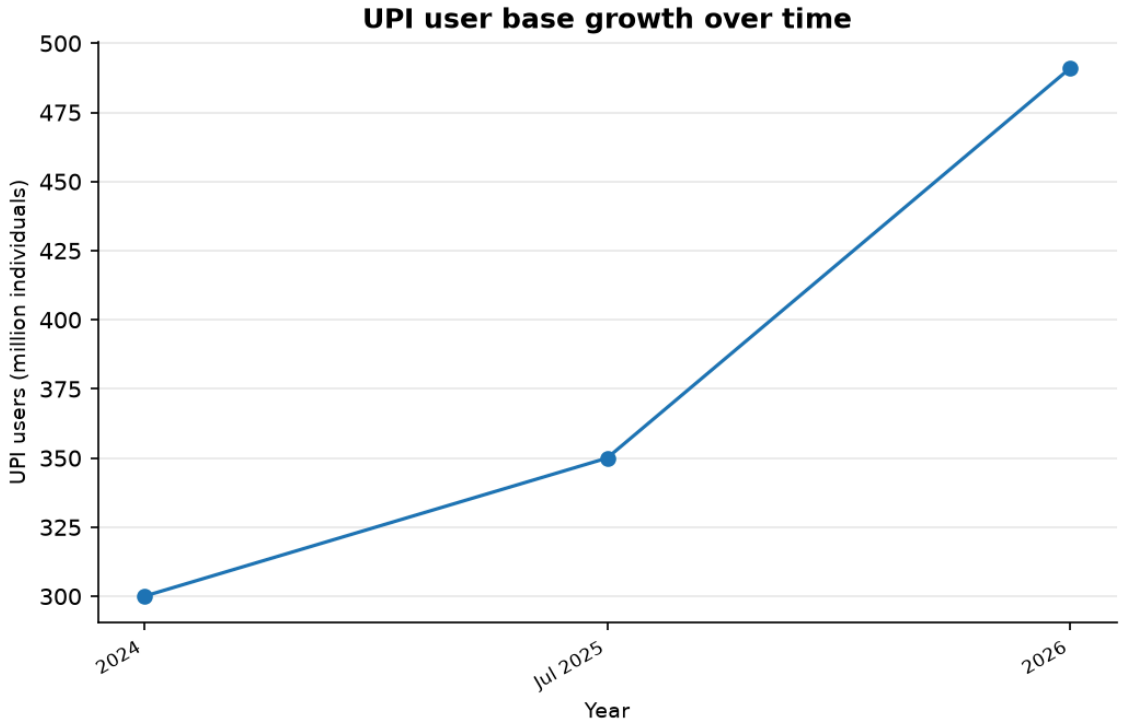

Later milestone claims in the evidence emphasize scale.[23][36] One source says UPI achieved a milestone in May 2025 by surpassing Visa with over 65 crore daily transactions, and another says UPI powers 85 per cent of India's digital payments.[23][36]

Usage statistics and adoption metrics

The strongest quantitative growth claim in the supplied evidence is that UPI transaction volume increased from 0.09 million in July 2016 to 16,730.01 million in Dec-2024.[18]

The evidence includes several point-in-time scale markers.[18][19][20][22][25] One source reports 9.41 billion transactions worth INR 14.89 lakh crore in May 2023, another reports 13.89 billion total transactions and a daily average of 463 million transactions in June 2024, and another reports 19.46 billion transactions and over $29 billion in payments in July 2025.[19][20][22] A PIB data point says UPI transaction value in FY 2025-26 was 314.23 lakh crore.[25]

The user and merchant base is also reported at very large scale, but the supplied sources differ on the current totals.[24][38][39][40] The evidence cites close to 300 million individuals and 50 million merchants, around 350 million active users with 340 million QR codes at merchant locations, and over 491 million individuals with 65 million merchants.[24][38][39][40]

Source: UPI figures from the provided evidence items

UPI user base growth (million individuals) over time

[24][39][40]

Ecosystem participants and interoperability

Participation is broad at the bank level, with more than 600 banks on UPI, and interoperability is enabled through participating-bank connectivity, open APIs, NPCI routing, and common identifiers such as UPI IDs and QR codes.[2][10][26][43]

The evidence says more than 600 banks participate in UPI.[26] It also says UPI is now the most used digital payment method in India and processes over 75 percent of India's retail digital payments.[16][34] Another supplied metric says person-to-person and person-to-merchant payments accounted for 99.5 percent of the 14 billion UPI transactions in June 2024.[21]

Interoperability is described in both technical and institutional terms.[2][10][43] One source characterizes UPI as an open-source interoperable API for real-time transfers between individuals with accounts at participating banks, while another says NPCI provides the ecosystem for routing, processing, and settlement services.[2][10] A USENIX paper adds that UPI enables instant transfers without sharing bank details and personal information by using mobile phone numbers, QR codes, or UPI IDs.[43]

Security measures, fraud prevention, and known vulnerabilities

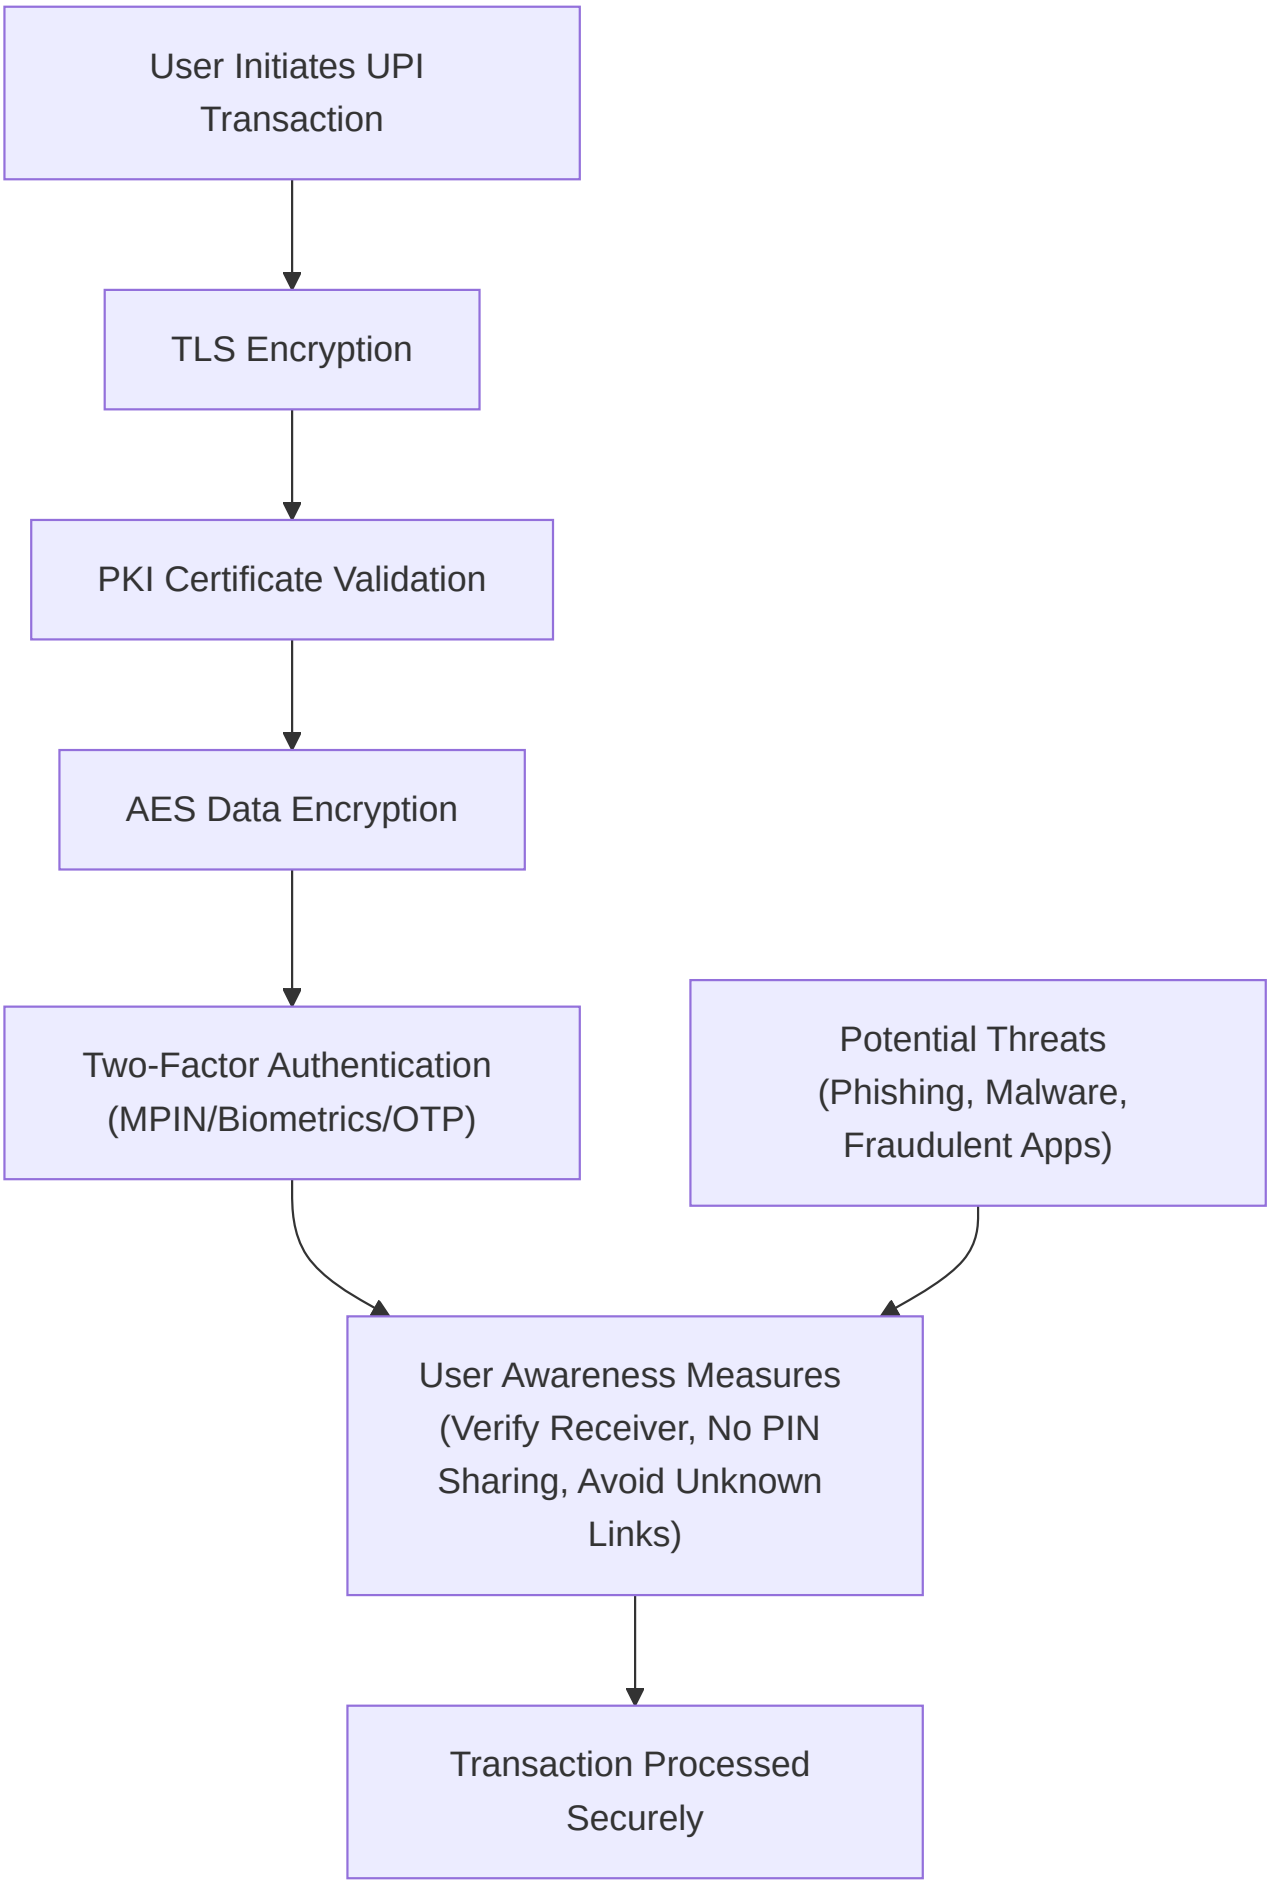

UPI's security model combines two-factor user authentication and encrypted transaction flows, but the supplied evidence also points to persistent fraud exposure through phishing, malware, fraudulent apps, social engineering, and user-awareness gaps.[6][27][29][30][31]

The supplied security evidence says UPI supports 1-click, 2-factor authentication with mobile as the first factor and UPI PIN as the second factor.[6] A design article adds that transactions are secured using TLS, AES, and PKI, and that customers authenticate using MPIN, biometrics, or two-factor authentication.[27] The USENIX paper says UPI allows instant money transfers without sharing bank details and personal information, using mobile phone numbers, QR codes, or UPI IDs.[43]

Evidence on fraud prevention emphasizes user behavior as well as platform controls.[28][32][33] A USENIX study says it analyzed 16 security information sources from regulatory bodies, UPI apps, and banks, and conducted 26 semi-structured interviews with UPI users.[32][33] That study

reports participants not sharing PINs, verifying receiver details, not clicking unknown links, and remaining aware of scams and frauds associated with UPI.[28]

The vulnerability evidence is centered on fast growth and uneven user awareness.[29][30][31] One source says rapid adoption has exposed users to phishing, malware attacks, fraudulent apps, and social engineering scams.[29] The same evidence says many users lack sufficient knowledge about secure transaction methods, password hygiene, and recognizing fraudulent activities, and that gaps in knowledge and behavior contribute to financial fraud.[30][31]

UPI security architecture and fraud prevention flow

[27][28][29][30][33]

Market impact on India’s payments landscape

The supplied evidence portrays UPI as a dominant payment rail in a market that was previously cash-heavy, with estimates ranging from over 75 percent to 85 percent of India’s digital payments.[17][34][36]

One source says that before UPI, India’s payment ecosystem was heavily reliant on cash, which accounted for more than 90 percent of transactions.[17] Another source reports that, in the past two to three years, 91 percent of respondents switched from cash to digital payments.[35] Evidence from the World Economic Forum also says over 43 percent of respondents preferred UPI over other payment modes.[37]

UPI’s current market position is described as both popular and economically significant.[16][34][41] The evidence says UPI is the most used digital payment method in India, and one source states that it has saved the economy approximately INR 5.5 lakh crore since inception.[16][34][41]

Economic and social impacts, including financial inclusion and merchant adoption

The supplied evidence links UPI’s social reach to its role in India Stack, its interoperable design, and very large reported merchant and user bases.[10][12][24][38][39][40]

A financial-inclusion source describes UPI as an open-source interoperable API developed by NPCI in 2016 for real-time transfers between individuals with accounts at participating banks.[10] Another source says India Stack combines Aadhaar, UPI, and DEPA.[12] Evidence from a rural India case study describes UPI as a mobile-based digital payment system that has transformed financial transactions in India.[42]

Merchant adoption is reported at exceptional scale, although the supplied sources differ on the precise totals.[38][39][40] The evidence cites close to 50 million merchants, 65 million merchants, and 340 million QR codes at merchant locations.[38][39][40] Individual reach is likewise reported in the hundreds of millions.[24][39][40]

In evidence tied to financial inclusion and rural India, the reported quantitative indicator is transaction growth from 0.09 million in July 2016 to 16,730.01 million in Dec-2024.[18]

Challenges and limitations

The main limitations highlighted in the supplied evidence are scaling demands, internet dependence, cybersecurity exposure, user-awareness gaps, and the current restriction of UPI to bank-account-based payment instruments.[29][30][44][45][46][48]

The architectural evidence says the system should handle millions of users and high transaction volumes, especially during peak hours, and cites horizontal scaling as a requirement as demand increases.[45] A separate design article lists horizontal scaling, load balancing, database sharding, caching, asynchronous processing, and CDN integration as mechanisms relevant to that challenge.[44]

User experience and reach can also be constrained by connectivity.[48] One survey-based source reports that internet limitations affected 58 percent of respondents.[48] On the security side, the evidence identifies phishing, malware, fraudulent apps, social engineering scams, and insufficient knowledge of secure practices as continuing weaknesses.[29][30][31]

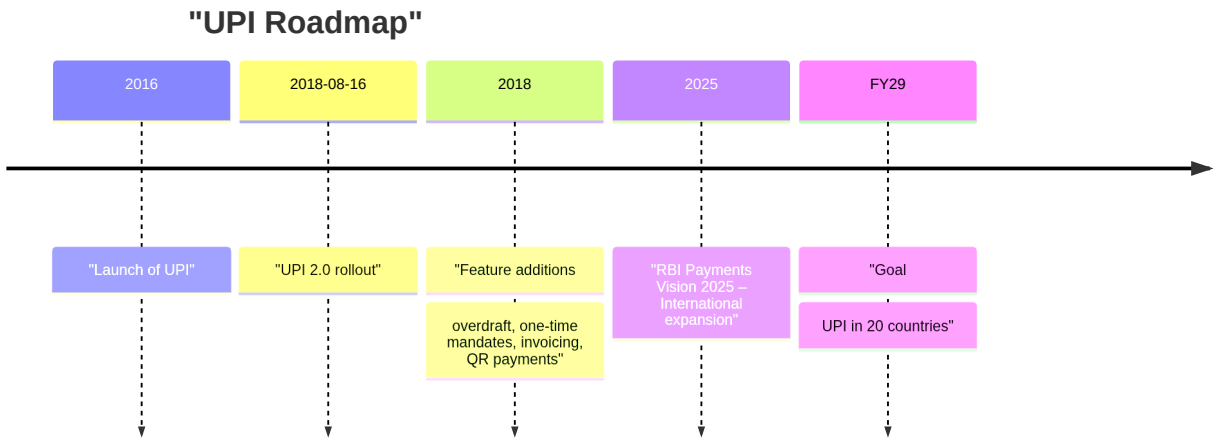

A product-scope limitation also appears in the timeline evidence.[46] The World Bank case study says UPI currently supports only bank account transfers, while support for PPIs is still in the pipeline and RBI has issued guidelines in this regard.[46]

Future developments and roadmap

The clearest roadmap claim in the supplied evidence is an international expansion plan aiming to take UPI to 20 countries by FY29.[49][50]

The future roadmap in the supplied evidence combines feature deepening with geographic expansion.[15][46][49][50][51][52] UPI 2.0 was rolled out on August 16, 2018, and the supplied feature summary says it added overdraft facilities, one-time mandates, invoicing, and QR-based payments.[15][52] The World Bank case study also says PPI support is in the pipeline under RBI guidelines.[46]

On internationalization, one source says RBI’s Payments Vision 2025 aims to expand UPI’s reach to 20 countries by FY29, while the same evidence set also says India plans to roll out UPI across 20 countries by FY29.[49][50] The expansion strategy is described as supporting seamless payments for tourists, efficient remittances, and enhanced cross-border trade efficiency.[51]
